

Scenario A1: Baseline: $M_p = R^2/p$ Δ_1 (First Derivative)

Scenario A2: Single Predictor ($p^*=1$): Classical=., argmin(..)=.

Scenario A3: Full Support ($p^*=20$): Classical=., argmin(.)= Δ_1 (First Derivative)

Scenario B1: AR1 Weak ($p^*=3$): Classical=., argmin(..)=.

Scenario B1: AR1 Strong ($p^*=3$): Classical=., argmin(..)=.

Scenario B2: Compound Sym.: $M_p = R^2/p$ Δ_1 (First Derivative)

Scenario B3: Block ($p^*=3$): Classical=., argmin(..)=.

Scenario C1: Weak Signals: $M_p = R^2/p$ Δ_1 (First Derivative)

Scenario C2: Many Weak ($p^*=10$): Classical=., argmin(.)=.

Scenario C3: Mixed ($p^*=8$): Classical=., argmin(.)=. Δ_1 (First Derivative)
